

Western Forest Products Limited

Tree Farm Licence 6 **2000** ANNUAL REPORT

The forest operations in Tree Farm Licence 6 are under an Environmental Management System (EMS) registered as conforming to ISO 14001 standards as issued by QMI, Registration No. 009680

Quatsino Tree Farm Licence 6 was granted to Western Forest Products' predecessor, British Columbia Pulp and Paper Company Limited, as Quatsino Forest Management Licence on October 25, 1950. On January 1, 1996 a small portion of TFL 6 south of Mahatta River in the SW corner of the TFL was deleted as part of an exchange agreement related to the Vancouver Island Land Use Plan. On October 1, 1998, the Minister of Forests approved a significant change to the original Tree Farm Licence. Block 4 of TFL 25 was consolidated into TFL 6 as Block 2. This Block comprises the watersheds of Queen Charlotte Strait between Fort Rupert and Port McNeill, and portions of the Quatsino Sound watershed. Alaska Pine and Cellulose Limited, another predecessor company, was granted this Licence on May 22, 1958.

This Annual Report records accomplishments and data for TFL 6 for the current year 2000. If you have comments on this report, please contact the Chief Forester at (604) 665-6224 or email at Chiefforester@westernforest.com. For further information on WFP's Sustainable Forest Management Plan visit our website at www.westernforest.com.

	Chum	40 232 fry
	Steelhead	2 500 fry
Employment	Direct Employment	168 263 person-days

PROJECT MAP

1.0 Introduction

1.1 Statement of Stewardship

Quatsino Tree Farm Licence 6 encompasses 198 113 ha of coastal forest on northern Vancouver Island. It has been managed by Western Forest Products Limited and its predecessors for 49 years. More than 50 million cubic metres of logs have been produced from these lands in that time. About forty percent of the total operable area of 157 000 ha remains in mature or old growth forest.

Internal and external audits and inspections indicated that a high standard of forest management was maintained during the year.

Rural North Vancouver Island communities, including Winter Harbour, Quatsino, Holberg, Port Hardy, Coal Harbour, Port Alice, and Port McNeill continue to receive significant economic benefits from the management activities on TFL 6. TFL 6 provided more than 935 direct full-time equivalent jobs in 2000. The economic and social benefits from TFL 6, combined with the Western Forest Products environmental stewardship program have resulted in a model of coastal forest management that is always adapting and changing as new information and objectives are identified. The company continues to refine and put into practice its social, environmental and economic principles.

1.2 Statement of Sustainable Forest Management

WFP's forest management is guided by three overarching principles. These are:

- Our operations must be economically viable. Our company must operate in a financially successful manner to meet shareholders expectations of a fair return on investment and to meet social and environmental commitments;
- Our actions must be socially beneficial to local, regional and First Nation's communities. WFP is committed to respecting, understanding and supporting First Nations, community and employee aspirations for stability and certainty;
- Our activities must be environmentally appropriate. WFP is committed to the protection of the environment and the sustainable development of the resources under our stewardship through sound forestry and environmental management practices that meet or exceed government standards.

Under these principles, our company is committed to:

- Sustaining, enhancing and protecting forest ecosystems while providing economic, environmental, social and cultural benefits
-

-
- Proposing and implementing allowable annual cuts that reflect forest ecosystems' capacity and sustainability as well as social and economic considerations
 - Identifying and assessing measurable indicators of sustainable forestry
 - Performing regular, internal and external monitoring for compliance with forest practices legislation
 - Committing to compliance achievements that meet or exceed legal requirements and public expectations
 - Utilizing forest practices appropriate to maintaining economic, social and environmental objectives
 - Planning for the long-term in an integrated manner to incorporate the full range of forest values including soil, water, fish and wildlife, archaeological, scenic resources and biological diversity
 - Investigating and researching habitat needs of fish and wildlife species and populations and establishing benchmarks for monitoring rare, threatened and endangered species
 - Maintaining and/or supporting active salmonid enhancement programs to sustain or increase salmonid populations through hatchery and habitat restoration programs
 - Maintaining biological diversity and conservation objectives at regional, landscape and stand levels.
 - Implementing restoration programs to address issues arising from past practices
 - Promoting a representative protected areas system within and adjacent to company forest tenures
 - Maintaining a practical, registered management system to guide and direct environmental aspects of company operations
 - Maintaining soil productivity by harvesting with environmentally appropriate systems
 - Engaging a team of dedicated professional foresters and planners committed to implementing and practicing sustainable forest management
 - Achieving a fair return to shareholders by operating in a financially successful manner
 - Continually enhancing our ability to plan and manage by promoting applied research and using leading edge inventory and modeling systems.
 - Promptly regenerating all areas after harvest with ecologically appropriate species to maintain and enhance forest growth
-

- Undertaking silviculture practices to enhance the value and volume of young forest stands.
- Managing operations to safeguard the health and safety of employees, contractors and the public
- Involving the public and stakeholders in meaningful consultation on all aspects of our forest management
- Respecting and recognizing First Nations traditional territories and forest uses through consultation and involvement in forest development planning
- Providing for First Nations' participation in setting and achieving sustainable forest management objectives
- Establishing employment opportunities through cooperative ventures with First Nations to increase the benefits of our operations to their economic and social well being
- Supporting the fair and affordable settlement of aboriginal land claims through negotiated treaties with involvement of all stakeholders
- Ensuring the health and sustainability of associated, resource-dependent communities.
- Cooperating and consulting with community resource boards and stakeholder groups with mandates for resource management planning and implementation
- Maintaining and enhancing opportunities for public enjoyment of forests through open road policies, recreation site development and management
- Developing our human resources through continuous training and recognition of employee contributions
- Communicating our performance to stakeholders and the public on a regular basis

Relatives of Alaska Pine founder, Walter Koerner, attended the official opening of the Port McNeill museum. The family made a substantial donation to this Millenium project which houses an impressive collection of company and community history.

1.3 Operations Highlights

Western Forest Products' parent company, Doman Industries Limited, had an improved financial situation in 2000. The year 2000 started out with stable lumber prices while pulp price increases continued their robust and consistent upward trend. By mid year, however, lumber markets had weakened dramatically as a result of an oversupply in North America. Demand and prices in Japan had also weakened.

The company took extensive downtime and production curtailments in both its sawmill and logging operations in the third quarter of 2000. The results improved significantly in the fourth quarter as the solid wood segment resumed production at more normal levels. Sales increased to \$955 million from \$873 million last year. Net loss for 2000 was \$26.5 million compared to a loss of \$57 million in 1999.

Operationally, both pulpmills had record production in 2000 with Squamish pulpmill producing 265 545 tonnes and the Port Alice sulphite pulpmill producing 158 805 tonnes.

Lumber sales declined to \$418 million on production of 680 million board feet. Pulp sales were up dramatically to \$382 million from \$262 million earlier, and log sales increased by \$34 million to \$126 million.

Timber harvest for the year was again in an undercut position with a total of 3.6 million m³ of recorded AAC or 89% of the available harvest volume. Stumpage payments increased slightly to \$86.7 million or an average of \$25.28 per cubic metre, exactly the same as in 1999.

The government introduced a pilot stumpage program, referred to as Market Pricing System (MPS) for coastal hemlock cutting permits. It was estimated that the company had a \$4 million savings from this change during the year. Further stumpage reforms are expected during 2001.

Sandy Lavigne, Environmental Programs Coordinator, and Mike Dietsch, NVIR Regional Forester staff a company booth in London, England at a certified forest products fair. The company's operations attracted much customer interest at this event.

Company Highlights

- The underharvest situation in the company's various tenures was partly addressed through the allocation of a 115 000 m³ non replaceable forest licence to the Oweekeno First Nation and the confirmation to allocate 303 000 m³ of underharvested AAC in TFL 6 for a First Nations licence. The current underharvest is in excess of 2 million m³ over the past five years, primarily due to weak markets and United States restrictions on lumber imports from B.C.
- A total of 273 kilometres of road were constructed and 109 km deactivated, 75 km of which were permanent. The company maintained a total of 2 386 kilometres of road in the company's 30 logging operations.
- The unresolved Central Coast land use situation and continued problems in the market place along with slow progress at the Central Coast LRMP table, resulted in the company joining voluntarily with other licencees in the Coast Forest Conservation Initiative. This initiative is a collaborative effort involving WFP, Weyerhaeuser, Canfor and Norske Skog working with several international and local environmental groups on a conflict free approach to jointly design an ecosystem based forest management model. By year end, considerable progress had been made and government had endorsed a plan for interim land use decisions at the Central Coast LRMP table by the end of March, 2001.
- The major forest policy review undertaken by the provincial government in 1999 reported out. While many public hearings were conducted and an extensive report written, the only evident policy change was the introduction of the MPS stumpage pilot.
- The company had an excellent year again with respect to Forest Practices Code compliance, with only 3 minor violations recorded out of a total of 669 inspections of company operations for a year end 99% compliance record.
- An assessment of the company's forestry practices and tenures on northern Vancouver Island was completed by SGS Forestry as part of a Forest Stewardship Council certification project. The assessment identified that the company had passed 179 out of 201 indicators. The outstanding requirements are a significant challenge and relate to ecological and biological diversity issues. A follow-up assessment of work completed during the year still showed major outstanding requirements by year-end.

Debbie Anderson, hatchery volunteer, tours SGS auditors at the Marble River hatchery during field review of the company's Northern Vancouver Island Region Operation as part of the initial Forest Stewardship Council assessment.

- The company was successful in achieving ISO 14001 Certification on all of its coastal forestry operations. The certificate was issued by the Quality Management Institute for the company's Environmental Management System (EMS) under registration number 009680. Eight environmental programs were established under the EMS and progress was made in all activities.
- During the year, 4 277 hectares were logged, of which 86% were in forests older than 250 years of age. The silviculture system applied was primarily clearcut with reserves on 87% of the cutting areas. There was only a very small amount of heli-logging during the year on 157 ha or 3.7% of logged area. No commercial thinning was undertaken. On average, 276 trees per hectare were logged.
- Avoidable residue from logging operations averaged 13.8 m³ per hectare with total residue of 33.1 m³ per hectare or about 96% utilization of total stand volume.
- A total of 3.9 million seedlings were planted during the year on 4 152 hectares. The company produced 2.6 million seedlings at its Saanich Forestry Centre Nursery. Regen surveys confirmed 79 hectares satisfactorily naturally regenerated. A total of 5 206 hectares of second growth were declared free growing and 1 465 ha of second growth areas were brushed.
- Forest Renewal BC expenditures totaled \$11.8 million with 717 hectares spaced, 774 hectares pruned and 1 316 hectares fertilized.
- There were also extensive FRBC supported watershed restoration projects completed during the year. A total of 22 500 person days of work were created through FRBC programs.
- A total of 1.6 million salmon fry were released from the four company sponsored, volunteer run hatcheries. Tours of company forestry operations attracted 1 243 participants.

Specific TFL 6 Highlights

- The reconstruction of the Holberg Community Hall was completed in February 2000. The original hall was lost in a New Year's Day 1999 fire. Replacement cost of the hall was approximately \$600 000. Since opening, the hall has been the venue for a number of community and private functions as well as ongoing sport and fitness activities.

The new Holberg Forest Operation community hall opened in January 2000, a year after a disastrous fire which destroyed the former hall. The new building is an attractive asset for the community in the company's largest logging operation.

- A new fueling and water-up facility was constructed by the Jeune Landing Operation at the Thurburn Log Dump.
- Port McNeill Operation completed logging its first block by contract helicopters in the Victoria Lake area of the south Marble River drainage.

- Construction work began on the Port McNeill Dryland Sort wood debris trial charcoal conversion plant. It represented an opportunity to develop new technology to address a serious problem.
- The Port McNeill Operation completed its first Retention Harvest trial block while Holberg and Jeune Landing Operations felled and partially logged their Retention Harvest trial blocks. The purpose is to test harvesting logistics,

Disposal of dryland sort debris on the North Island is a complex problem and urgently requires a solution due to planned debris burning restrictions by government. WFP is working with an inventor to produce charcoal from the debris for commercial purposes. A pilot plant has been built on company lands near Port McNeill.

- windfirmness and opportunities to meet biodiversity objectives on the TFL. It remains a commitment under the company's strategy for achieving FSC certification.
- Jeune Landing Operation built Yreka Mainline on the west side of Neuroutsus Inlet to access and fall timber in cutblocks 420 and 421. Development is developing according to the visual landscape analysis completed for this sensitive viewscape.
 - As part of response to windfall studies completed within the North Vancouver Island Region, Holberg Operation began an operational aerial pruning program. Four riparian areas were treated and the results will be monitored.

Patrick Moore addresses a memorial service in Holberg for his father Bill Moore who died on November 23, 2000. Bill was born in Swanson Bay in the Central Coast and had a lifelong relationship with the company, most recently as owner of W.D. Moore Logging Limited at Winter Harbour, a contract logging operation for the past 50 years in TFL 6. Bill made many positive contributions to the forest industry during his colourful career.

2.0 MANAGEMENT AND OBLIGATION PERFORMANCE

2.1 Volumes

Scaled timber production for the year was 1 136 285 m³. Volumes by timber mark and Operation are summarized in Appendix I. The volume charged to the allowable cut including scaled production and residue survey volumes was 1 174 013 m³ (Appendix II).

Rick Lyngen, a Quatsino Dryland Log Sort worker, took this wide-angle shot of the company's main log sorting operation in Tree Farm Licence 6. The Quatsino sort processes approximately 1 million cubic metres of logs annually.

2.2 Area

The Company harvested timber from 1 264 ha during the year. Appendix III summarizes the denudation by Operation. Ten percent of the area logged was classified as medium, low, or very low ecosites. The low site partitioned AAC volume requirement was significantly exceeded (Appendix IX). The non-productive area in the TFL was increased by 77.7 hectares to account for the formerly productive area occupied by new roads.

2.3 Contractor Compliance

Harvesting and forest management activities on TFL 6 during the year employed contractors and Company personnel. The Contractor Clause requirement of logging equivalent to 50% of the Crown portion of the AAC was exceeded by 15 per cent (Appendix VI). Appendix VII lists the phase and full-harvesting contractors. Appendix VIII lists all contractors employed in harvesting, silviculture, and resource management on the TFL.

2.4 Planning

2.4.1 Land and Resource Management Plans

In February 2000 Cabinet endorsed the Vancouver Island Summary Land Use Plan (VISLUP). This Summary Plan provides the key components of the 1994 land use decisions made for Vancouver Island. On December 1, 2000 the Vancouver Island Land Use Plan Higher Level Plan Order (HLP) came into effect. The HLP outlines a number of objectives affecting operational and landscape unit planning that differ from those outlined within VISLUP. The HLP objectives that affect TFL 6 are Objectives 1, 2, 3, 6, 7, 8, 9, 10, 15, 16, 17 and 18, a summary of which are in table 1.

Table 1: Summary of the Vancouver Island Land Use Plan Higher Level Plan Order

Objective No.	Application Area	Scope	Goal /Method
1	SMZs 2 and 4	Landscape Level	Goal: Maintenance of stand structure and attributes associated with mature and old forests. Method: Retention of within cutblock reserves; Maximum opening size for clearcut, clearcut with reserves and seed tree silviculture systems is 5 hectares; Maximum opening size for retention, shelterwood and selection silviculture systems is 40 hectares; Provide a variety of silvicultural systems within a LU.
2	SMZs 2 and 4	Landscape Level	Goal: Provide for the salvage of damaged timber Method: Cutblock size limits stated in Objective 1 can be exceeded to facilitate the salvage of damaged timber.
3	SMZ 4	Operational Plans	Requires the joint of approval of Ministry of Environment, Lands and Parks and Ministry of Forests
6	SMZ 2	Operational Plans	Goal: Protect Visual Quality of Area Method: Requires the management for Visual Quality.
7	Enhanced Forestry Zones (EFZ)	Operational Plans	Goal: To remediate timber impacts associated with SMZs. Method: Decrease green-up heights within EFZs. Allow larger opening sizes (>40 ha) within EFZs.
8	Enhanced Forestry Zones (EFZ)	Operational Plans	Goal: Protect hydrological integrity when implementing Objective 7. Method: DM has authority to not approve green-up and opening size changes outlined in Objective 7 where they would impact the hydrological integrity of the area.
9	Enhanced Forestry Zones (EFZ)	Operational Plans	Goal: To remediate timber impacts associated with SMZs Method: Allow use of single species plantations
10	Resource Management Zone 7 (RMZ) Marble	Landscape Level Plans	Goal: To remediate social and economic impacts of completion of Landscape Unit Planning. Method: Allows for the recruitment of second growth to achieve the old seral target within CWHvm1 during Landscape Unit Planning.
15 & 16	Resource Management Zone 8 Mahatta – Nerotsus	Landscape Level Plans	Goal: Provide for Marbled Murrelet habitat within the Landscape Unit Planning process. Method: Focusses establishment of OGMA's in high MAMU valued habitat during Landscape Unit Planning.
17 & 18			Provided transition provisions for the implementation of the HLP Order

Forestry costs associated with higher level planning, including land and resource management planning and landscape unit planning, were \$192,778.

2.4.2 Forest Development Planning

2000 was the first year that the digital FDP maps were prepared in-house by regional staff. In August a Geomatics Technician was hired in North Vancouver Island Region to carry out mapping functions associated with operational and forest development plans. All Operations complied with Forest Development Plans (FDP) approved in 1999. Port McNeill Forest Operation submitted a FDP covering a period of 2000 to 2005 in accordance with the Ministry of Forests' Policies and Procedures. Forest Development Plans preparation and compilation costs totalled \$59,279.

Phil Wainwright, Resident Engineer in Port McNeill and George Bates, a member of the public, review the TFL 6 Draft Management Plan 9. A total of 13 public and stakeholder sessions attracted 167 participants to review the draft plan which will become effective in November 2001. Public comments were utilized to amend the draft plan.

2.4.3 Silviculture and Harvest Planning

2.4.3.1 Cutting Permits and Cutting Permit Cruising

The number of active cutting permits in TFL 6 increased from 50 in 1999 to 76 in 2000 continuing the disturbing trend seen since the Ministry of Forests moved to Forest Licence styled permits for TFLs. Prior to this policy change only 9 roll-over cutting permits were required to harvest the same volume. Associated administrative costs have increased accordingly. Table 2 lists the active cutting permits, locations and expiry dates.

Cutting permit cruising plot costs decreased from 1999 costs due, in part, to a high proportion of plots in lower cost operations. Average cost per established plot for TFL 6 was \$129. Average cost per compiled plot was \$54. The weighted field plot cost was \$103. A total of 987 cutting permit cruising plots were established in TFL 6. Seventeen cruise reports were compiled using data from 2,363 plots.

Total contractor cost was \$122,277. Forestry department costs associated with cutting permits and cutting permit cruising including contractor costs totalled \$161,457.

Table 2: Active Cutting Permits

502	Apr 30/01	Port McNeill	98	Apr 14/01	Port McNeill

2.4.3.2 Road Permits

The Company maintained three Road Permits in 2000, as listed in Table 3.

Table 3: Active Road Permits

Road Permit	Expiry Date	2.4.3.2.1 Operation
R06936	Open	Port McNeill
R06897	Open	Jeune Landing and Mahatta River
R06896	Open	Holberg, Botel, and Winter Harbour

2.4.3.3 Silviculture Prescriptions

Forty-four new silviculture prescriptions were submitted during the year (Table 4). The total area for which new silviculture prescriptions were submitted was 1 708.7 ha. Average block

size including reserves was 38.8 ha. Average reserve area varied from 11.0 per cent to 13.9 per cent by Operation, with a weighted average of 12.5 per cent.

Forestry costs for new silviculture prescriptions and amendments to previously submitted prescriptions totalled \$155,392.

Table 4: Silviculture Prescriptions

Operation	Submitted SPs (#)	Total Area (ha)	Average Block Size (ha)	Minimum Block Size (ha)	Maximum Block Size (ha)	Average Reserve (%)
Holberg	21	864.2	41.2	11.8	60.3	13.9
Jeune Landing	9	295.4	32.8	15.9	43.3	11.0
Port McNeill	14	549.1	39.2	22.1	45.9	13.4
TOTAL	44	1708.7	38.8	11.8	60.3	12.8

2.4.3.4 Pest Management Plans

Jeune Landing Forest Operation's Pest Management Plan (PMP) was approved during the year. The plan is for a 5 year period expiring July 31, 2005. This plan is the first approved Pest Management Plan within TFL 6. Holberg Forest Operation conducted pesticide work under the old Pesticide Use Permit (PUP) process. Holberg plans to replace the PUP within a new PMP in 2001.

2.4.4 Public Involvement

2.4.4.1 Forest Development Plans

Holberg Forest Operation received a two-year approval on their 1999-2004 Development Plan. Port McNeill Forest Operation prepared a new plan that was presented at a community open house as well as being available for sixty days at WFP and Ministry of Forests offices. Special presentations given to with the Kwakiutl First Nation and scheduled for early in 2001 with the Quatsino First Nations to explain proposed activities within their traditional territories.

Table 5: Forest Development Plan Reviews

Operation	Plan	Location	Attendance	Written Responses	Oral Responses
Port McNeill	2000-2005 FDP	Port McNeill	16	6	

2.4.4.2 Sustainable Forest Management Plans

In November 2000 the TFL 6 draft Management Plan (MP) 9 was reviewed at meetings of stakeholders, First Nations and at several open houses. A total of 13 sessions were held in the North Vancouver Island Region area. More than 160 persons were in attendance at the various sessions. All participants were encouraged to submit written comments and 18 were received. Written responses included 2 letters, 1 email, and 15 response sheets.

Senior Ministry of Forests and WFP staff toured TFL 6 as part of the due diligence review for the new Management Plan 9 scheduled for approval in 2001.

2.4.4.3 High Conservation Value Forests

The High Conservation Value Forests Report was updated to incorporate the comments received through public consultation. The statement was also updated on Western Forest Product's website. The key components of the report were incorporated into the Draft Sustainable Forest Management Plan that was made available for public review as discussed above. No new written responses were received regarding the statement.

2.4.4.4 Forest Education and Special Events

The Company continued its support of the North Island Discovery Centre (NIDC). The NIDC was previously known as the North Island Forestry Centre. The name was changed to attract more visitors. This non-profit society co-ordinated summer tours of logging operations on the North Island. Operations hosted a total of 77 guests on 5 tours. These tours included forest management activities and discussions on forest practices with Western Forest Products employees. The number tours in 2000 are considerably less than previous years as logging operations in TFL 6 were not in operation for the month of July and no tours took place during that time.

During 2000 a total of 200 people on 13 tours were guided throughout the TFL as part of the summer program. Popular with tourists and locals, the day long tours are conducted weekly.

Holberg Operation conducted three individualized group tours. One tour group was from the Rotary Club, one tour group was from the Forest Land Commission and one tour was for special guests staying in Holberg. In all there were 59 participants in these three tours.

Port McNeill Operation hosted two individualized group tours in 2000. One tour was for the Port Hardy Rotary Club's visitors from Japan and the other tour was for the local scouting group. These two tours had a total of thirty-seven participants.

All operations made presentations to elementary school students for National Forestry Week. Many company foresters also participated in other School District activities.

North Vancouver Island Region hosted numerous special tours. The Global Forest Trade Network sponsored by the Certified Forest Products Council toured the North Island and discussed WFP's certification initiatives with keen interest. WFP also hosted the Assistant Chief Forester and several other senior Ministry of Forests officials on a tour of the TFL to review issues related to the Draft Management Plan.

The Company spent \$95,010 on tours and special events in TFL 6. In addition, the Company's Public Projects fund contributed \$10,960 to Forest Education efforts in the TFL. Additional public relations costs associated with Forest Renewal BC events or projects are covered by the Multi-year Agreement.

2.5 Inventories and Mapping

2.5.1 Geographic Information System and Electronic Mapping

Five GIS stations were used for corporate resource inventory mapping and analysis. WFP continues to use Pamap as its GIS system of choice; however the use of ArcView, Microstation GeoGraphics, FME and World Construction Set are being utilized to perform a multitude of analysis and data processing tasks.

Microstation (CAD) systems are utilized for operational mapping. Currently, there is one full time CAD operator in the North Vancouver Island Region. The addition of this position has greatly improved efficiencies within the mapping department.

Training opportunities and support provided by PCI Geomatics, Pacific Alliance Technologies and BCIT were used to advance the skills of GIS personnel.

GIS costs totaled \$ 24,201.

2.5.2 Forest Inventory

TFL 6 digital files were updated to January 1, 2001 to incorporate changes to forest cover, roads and logging history that occurred during 2000.

Photo interpretation and quick plot ground sampling for the new Vegetated Resource Inventory (VEG) was completed in TFL 6. A sampling plan was completed in late 2000 for ground and net volume adjustment factor sampling. Fieldwork is to start in early 2001 and will be completed by March 2001. This new inventory will provide planning and field staff with improved information regarding second growth forest.

Cost for forest inventory and operational mapping work totaled \$293,306.

2.5.3 Ecosystem

Minor ecosystem classification revision work was undertaken in the TFL and classification of the Forest Licence area to the north of TFL 6 started and is expected to be finalized in 2001. Cost for TFL ecosystem work totaled \$ 4,773.

2.5.4 Geotechnical Analyses

Engineering consultants were employed to complete geotechnical analyses of cutblocks and road construction and deactivation projects throughout TFL 6. Table 5 details the consultants employed by Operation. Costs for geotechnical analyses are included in logging costs.

Table 5 Geotechnical Analyses

Operation	Geotechnical Firm	Cutblocks	Roads
Jeune Landing	Arbor Tech	8*	0
Port McNeill	Arbor Tech	1	4
	Vandine Geological	0	1
Holberg	Westrek Geotechnical Services	10	3
	Golder Associates	0	1
TOTAL		19	9

* The 8 cutblock Geotech analyses done by Arbor Tech in Jeune Landing were a combination of both cutblocks and road analyses

2.5.5 Resource Inventories and Assessments

A large number of inventories and assessments were completed during the year, many to support the preparation of operational plans and the new Management Plan. Except where indicated, costs for these inventories and assessments were incurred by the Forestry Department, and totalled \$122,233.

2.5.5.1 Archaeology

Sources Archaeological & Heritage Consultants completed 11 Archaeological Impact Assessments (AIAs) in cut blocks in the Holberg, Winter Harbour, Koprino, Port McNeill and Coal Harbour operating areas. Representatives of the respective First Nation's were involved in all of these assessments. Operational plans were adjusted to protect Culturally Modified Trees and other archaeological features identified in these assessments. Archaeological Impact Assessment reports were provided to the Quatsino First Nation, the Ministry of Forests and the Heritage Conservation Branch. Costs for cutblock archaeological assessments are included in logging costs.

2.5.5.2 Streams

Stream classification assessments were carried out on 36 cutblocks and roads during the year in advance of final cutblock and road engineering. This information was used to designate riparian reserves and riparian management zones in each cutblock. Fishfor Contracting completed all surveys. Costs of stream classifications are included in logging costs.

Western Forest Products began fisheries inventory work in the Keogh Watershed. Work was done to Resource Inventory Committee (RIC) standards. Inventory work within this watershed is expected to be completed in 2001.

Forestry department costs for stream assessments and inventory work totalled \$79,646. All of which was recovered from FRBC.

2.5.5.3 Wildlife

Wildlife work in TFL 6 focused on the completion of detection surveys for Marbled Murrelets and Northern Goshawks. Several marbled murrelets were detected during the surveys. One Northern Goshawk nest was located along Holberg Inlet north of Norton Point. This nest was located in a mix of second and old growth forest. Costs for this work totaled \$40,518.

Bear cubs are a common site in TFL 6 and these were seen on Northeast 60 in the Holberg Forest Operation. Black bear populations have increased in recent years due to good habitat and weather conditions.

2.5.5.4 Landscape Unit Planning

Work began on Landscape Unit Planning in cooperation with the Ministries of Forests and Environment. Several meetings were held with the ministries and some potential Old Growth Management Areas were delineated within the San Josef Landscape Unit. Preliminary work also began within the Marble Landscape Unit. Landscape Unit (LU) Plans are expected to be completed for both San Josef and Marble LUs in 2001 with the other LUs to follow in the following few years.

3.0 MANAGEMENT OBJECTIVE ACHIEVEMENT

3.1 Management and Utilization of Timber Resource

3.1.1 Harvesting Methods

Six logging systems were used in TFL 6 in 2000 (Figure 1). In areas managed by Jeune Landing (including Mahatta River) grapple yarders harvested the largest portion of the volume, 48 per cent, followed by the supersnorkel at 23 per cent of the volume. Both the tower and hoe forwarding logging systems each accounted for 9 percent of the volume harvested at Jeune Landing while the skyline system accounted for 7 percent of the volume harvested. Jeune Landing also used the heli-logging harvesting system and produced 4 per cent of the total volume by this method.

Holberg, Botel, and Winter Harbour used grapple yarder, super snorkel, and hoe forwarding logging systems (Figure 1). Hoe Forwarders harvested 49 per cent of the volume, super snorkels 27 per cent, and grapple yarders 24 per cent.

Port McNeill Forest Operation used a hoe forwarders, a tower, a super snorkel, and grapple yarders. Port McNeill Operation also heli-logged in the Victoria Lake area of the operation during 2000. (Figure 1). This was the first year that Port McNeill harvested with the helicopter logging system. The super snorkel handled 44 per cent of the volume. Grapple yarding accounted for 23 per cent of the volume, hoe forwarding accounted for 16 per cent of the volume and heli-logging accounted for 7 per cent of the volume. The entire tower logging volume, 10 per cent, was completed by Quatsino Forestry.

Figure 1: Logging Volumes by Harvest Systems and Operation

3.1.2 Silviculture Systems

Patch clearcut with reserves is the main silvicultural system employed at all Operations. 38 of the 46 areas harvested in 2000 were clearcut with reserves. 37 of the 52 blocks engineered during the year will use this system. Average reserve area exceeds ten per cent of the gross area of each block. Table 7 provides a silviculture system summary by Operation.

Table 7 Silvicultural Systems by Operation

Operation	System	Blocks Engineered (#)	Average Block Size (ha)	Minimum Block Size (ha)	Maximum Block Size (ha)
Holberg	Clearcut with Reserve	19	75.5	28.7	117.7
	Retention	5	59.7	49.2	70.5
Jeune Landing	Clearcut with Reserve	10	22.9	9.5	45.1
	Retention	2	32.1	17.5	46.7
Port McNeill	Clearcut with Reserve	8	28.26	16.4	45.8
	Retention	7	42.58	36.80	46.40
	Windfall Salvage	1	0.80	0.80	0.80
Operation	System	Blocks Harvested (#)	Average Block Size (ha)	Minimum Block Size (ha)	Maximum Block Size (ha)
Holberg	Clearcut with Reserve	16	114.9	58.7	146.9
Jeune Landing	Clearcut with Reserve	12	31.4	19.0	47.3
Port McNeill	Clearcut with Reserve	10	32.34	6.60	47.20
	Retention	1	44.0	44.0	44.0
	Windfall Salvage	7	1.30	0.16	3.40

3.1.3 Felling, Bucking, and Utilization Specifications

3.1.3.1 Specifications

Cutting permits outline the required and optional utilization standards. In general:

- Maximum stump height of 30 cm on shortest side;
- All old growth coniferous trees containing X grade logs or better will be utilized to a top diameter of 15 cm inside bark (10 cm for second growth);
- All conifer trees or parts of these trees exceeding 3 m in length which contain X grade logs or better will be removed;

- iv. Logs or parts of logs less than 3 m in length and broken at ends are classed as breakage;
- v. Logs will not be bucked or trimmed in a manner that reduces grade.

These requirements apply to all living and dead trees that meet the standards. Quality control is maintained by WFP staff with the aid of a quality control consultant and monitored through felled and bucked inspections and residue surveys.

3.1.3.2 Residue Surveys

The Company continues to survey and report residue volumes on a calendar year basis for all cutblocks where logging is complete. There were a total of 250 plots established during the 2000 survey year. The hectares surveyed in 2000 remained lower than historic levels as a result of market induced production curtailments at the end of 1999. For these areas surveyed in 2000, AAC depletion totaled 28 442 m³ or 25.5 m³/ha, while the billable waste volume totaled 11 455 m³ or 10.3 m³/ha (Table 8).

The contractor costs for residue sampling and compilation were \$20,795 or \$93 per plot. Total costs of residue assessments were \$47,462.

Table 8 Residue Assessment Survey Summary

LOCATION	SURVEY AREA		AAC DEPLETION		BILLABLE WASTE TOTAL VOLUME		NUMBER OF PLOTS				
	Gross (ha)	Net* (ha)	m ³ /ha	m ³	m ³ /ha	m ³	Slash	Road Side	Pile	Other	Total
Holberg	544.1	445.3	27.9	12426	14.1	6299	30.0	26.0	26.0		82.0
Jeune Landing	470.8	407.6	25.4	10341	8.3	3373	30.0	28.0	30.0	10.0	98.0
Port McNeill	327.4	261.8	21.7	5675	6.8	1783	18.0	18.0	18.0	16.0	70.0
TOTAL	1,342.3	1,114.7	25.5	28442	10.3	11,455	78.0	72.0	74.0	26.0	250.0

3.1.3.2 Special Forest Products

Special Forest Products harvested in 2000 included salvage logs, cedar shake and shingle blocks, yew bark, salal, cedar oil, and gravel (Appendix XI). More than 9 600 m³ of shake and shingle blocks were salvaged (Appendix XI). Port McNeill reported 5 350 m³ of shake and shingle volume, an increase of twelve percent compared to the previous year. Both Holberg and Jeune Landing reported lower salvage volumes for shake and shingle than the previous year. Holberg reported 2406 m³ and Jeune Landing reported salvage of 1 861 m³. The decline in TFL 6 salvage volume for Holberg can be attributed to one of the agreement holders re-focussing on the adjacent Forest Licence. These salvage areas were completed in 2000 and the shake and shingle volumes are now at a normal level of production despite the apparent drop in volume for 2000. As well, Holberg saw an increase in salvage log volume in 2000.

Although the Port McNeill Operation reported no yew bark harvest, the Jeune Landing Operation reported 554 kg in 2000. (Appendix XI).

Port McNeill Forest Operation sold 21 554 m³ of gravel in 2000. This represents a decrease of 19 per cent decrease from the previous year.

The cedar oil contractor continued producing cedar oil at Port McNeill Operation. Processing of cedar boughs produced 1394 litres of cedar oil, 12 percent more than last year. (Appendix XI)

The Forestry Department administered the Minor Products program at a cost of \$38,402.

Doug Folkins, the new Resident Forester for the Holberg Operation, meets with John Talbot during a tour of the Talbot Forest Venture salvage lumber mill. Low value logs are salvaged from operating areas as part of deactivation and minor products programs.

3.1.4 Partitioned Harvest

The Allowable Annual Cut for TFL 6 has been partitioned into Conventional and Low Site Volumes. Appendix IX reports the 2000 partitioned volume as required in Management Plan 8. The low site volume is estimated by matching low site harvest area to inventory volumes. On this basis Western Forest Products' produced 214 908 m³ from low site lands which significantly exceeds the low site target of 52 000 m³ per year.

3.1.5 Annual Allowable Cut and Cut Control Performance

The Allowable Cut available to Western Forest Products on TFL 6 for 2000 was 1 464 264 m³ (Appendix IV). The chargeable cut for the year, including the scaled production and the recognized residue survey volumes, was 1 174 012.5 m³ (Appendix II). The cumulative volume charged after first year of the current five-year cut control period is 1 174 013 m³ or 16 per cent of the five-year total allowable cut (Appendix IV).

The historic cut control is presented in Appendix V. Western Forest Products and its predecessors have harvested 51 173 838 m³ since the granting of the Licence in 1950. To the end of 2000, the accumulated Allowable Cut was 51 447 794 m³. The rate of harvest is at 99.47 per cent of the Allowable Cut to date as determined by the Chief Forester of BC.

3.1.6 Small Business Forest Enterprise Program

The Small Business Forest Enterprise Program (SBFEP) has been in place since 1988. There has not been any new Block 1 SBFEP volume added to the program since a 1996 volume exchange agreement was reached with the Ministry of Forests. At the time that the agreement was made, there was still a “backlog” of TFL 6 SBFEP volume that the Ministry had not issued as Timber Sales. This backlog volume is still available to the Program. The current SBFEP allocation in TFL 6 from Block 2 is 13 242 m³ per year. In 2000 the Port McNeill Forest District reported that a chargeable volume of 47 800 m³ (Appendix X) harvested by B.W. Creative Wood Industries and Lukwa Mills of Port Hardy.

3.2 Protection and Conservation Measures

Western Forest Products protected and conserved identified resource values in TFL 6 during the year. The following sections discuss planning and operational measures taken to protect other resource values. Blocks for which amendments were submitted and blocks in which harvesting was not completed are not included in Table 9.

Veteran red cedar snags overtop second growth regeneration in the Holberg area and provide valuable wildlife habitat due to their height and soft wood.

3.2.1 Visual Quality

12 of the 52 blocks engineered during the year required special engineering to address visual concerns (Table 9). 3 of the 36 blocks harvested during the year had been similarly modified to address visual issues. Modification includes movement of backlines and the location of reserves to minimize the visual impacts of harvesting. Scenic areas where visual quality is a priority were identified in Forest Development Plans.

3.2.2 Biological Diversity

Biological diversity issues were addressed through the establishment of stand level reserves as well as landscape level deferrals. In addition to Code reserves, Holberg reported special conservation measures were taken in 5 of 24 engineered blocks and 1 of 16 harvested blocks. Jeune Landing reported special conservation measures were taken in 2 of 12 harvested blocks. Port McNeill reported special conservation measures were taken

in 1 of 16 engineered blocks and 1 of 20 harvested blocks. (Table 8). These special measures were addressed in the Silviculture Prescriptions.

3.2.3 Soil Stability Maintenance

3.2.3.1 Conservation

4 of 36 harvested blocks required special stability assessments and 24 of 52 engineered blocks required special stability assessments. Soil resources were protected at all Operations (Table 9).

3.2.3.2 Operational Site Stabilization Program

Erosion control treatments were carried out at Jeune Landing (2.5 ha) and Holberg (2.7 ha) Operations (Appendix XI). Grass seeding of cut slopes, slides and sensitive sites in current logging blocks is a Company responsibility under the Forest Practices Code. Costs for the site stabilization program totalled \$111,179.

Table 9 Protection and Conservation Measures.

Operation	Blocks Engineered	Number of Blocks Requiring Special Consideration								
		Visual Quality	Biological Diversity	Soil Stability	Water Quality	Recreation Resources	Cultural Heritage	Fish Habitat	Wildlife Habitat	Cave/Karst Features
Holberg	24	8	5	17	1	1	6	21		
Jeune Landing	12	3	2	5	3			3	2	
Port McNeill	16	1	1	2		1	1	13		
TOTAL	52	12	8	24	4	1	1	37	2	0
Operation	Blocks Harvested	Number of blocks Requiring Special Consideration								
		Visual Quality	Biological Diversity	Soil Stability	Water Quality	Recreation Resources	Cultural Heritage	Fish Habitat	Wildlife Habitat	Cave/Karst Features
Holberg	16	3	1	9	1		7	10	2	
Jeune Landing	0									
Port McNeill	20		1	4		1		7		
TOTAL	36	3	1	4	1	1	7	7	2	0

As part of TFL 6 road deactivation and watershed restoration programs, helicopter seeding of isolated disturbed sites is undertaken. West Coast Helicopters delivers hydro-seed mix to slopes in the O'Connell Lake area of Mahatta River. More than \$1.6 million was spent in TFL 6 on FRBC financed watershed restoration activities during 2000.

3.2.3.3 Watershed Restoration Program

Forest Renewal BC fully funded seven watershed restoration projects in TFL 6 (Table 10). French Creek Forest Services Ltd. coordinated the program on behalf of the Company. Accomplishments included 24 km of road deactivation and 2 km of in-stream restoration (Appendix XXIII). Program implementation and administration costs were \$1,623,500.

Table 10 Watershed Restoration Program Summary

Watershed	Level II	Road Deactivation	Fish Habitat Restoration	Monitoring	Riparian Rehabilitation	Spending
Colonial			.55 km			91,000
Keogh		3.7 km	1.0 km		15.0 ha	197,000
Klutchlimmis						5,000
Hushamu		5.6 km				125,000
Howlall			0.8 km			62,000
Mahatta						25,000
Victoria East		0.4 km				54,500
Victoria West		13.9 km				1,064,000
TOTAL		23.6 km	2.35 km		15.0 ha	1,623,500

3.2.4 Water Quality

Special engineering to maintain water quality was required for 1 engineered block and 1 harvested block at Holberg. 3 of 12 engineered blocks in Jeune Landing required special engineering to maintain water quality. (Table 9).

3.2.5 Recreation Resources

3.2.5.1 Public Recreation Sites

Maintenance of public recreation sites, including provision of firewood and cleaning of facilities was carried out during the summer tourist season. At Holberg the Spencer Cove Recreation Site was brushed to improve the area. Danger trees were removed from the Palmerston Point Recreation Area for public safety. There was 300 m more trail completed in the Spruce Bay recreation area at the Jeune Landing Operation. As well, there was a new firewood shelter and picnic tables were installed.

The Company's Public Projects fund covered \$56,348 recreation site maintenance and upgrading costs. The Forestry Department spent an additional \$91,032 on FRBC recreation projects. Forest Renewal BC funds reimbursed \$21,196.

3.2.5.2 Recreation Use

There is extensive use of TFL 6 for a variety of recreational activities estimated in Table 11. These are based on visits recorded to maintained sites, issued permits, and information from the tourism industry. The number of tourists declined in 2000 probably due to the poor economy of the province.

Table 11 Recreation Use Estimates

Activity	User Days By Operation			
	Holberg	Jeune Landing	Port McNeill	Total
Beach Use	1800	100	850	2750
WFP Sites and Trails	3500	4000	3500	11000
Hunting	350	800	750	1900
Fishing (Freshwater)	350	2000	1200	3550
Fishing (Saltwater)	1400	2000	1500	4900
Firewood Cutting	350	1000	680	2030
Food Gathering	75	500	250	825
Kayaking	450	300	75	825
Whale Watching	15	0	0	15
Auto Touring	9500	4000	1500	15000
Hiking and Caving	750	200	200	1150
TOTAL	18540	14900	10505	43945

3.2.6 Cultural Heritage Resources

All cultural heritage values identified through inventories and assessments are protected during development. When undocumented resources are discovered, operational plans are altered to ensure their protection. Port McNeill Operation modified plans for 1 future blocks for cultural heritage values in 2000 and Holberg Operation modified 6 engineered blocks for cultural heritage values (Table 9). Port McNeill also modified one harvested block to protect cultural heritage. Management strategies were developed in consultation with the local First Nations bands.

3.2.7 Fish Habitat

3.2.7.1 Conservation

Protection and conservation of fish and fish habitat requires the designation of riparian reserve and riparian management zones at the engineering stage. In 2000, 37 of 52 engineered blocks required special management to protect fisheries values. 7 of 36 harvested blocks had required similar attention (Table 9). Harvesting requires special falling and yarding techniques near these zones and at times, specialized treatments such as aerial pruning, to increase windfirmness are required.

Peter Barrett of West Coast Helicopters delivers adult chinook salmon from the lower Marble River to the volunteer run hatchery. Lyle Flostrand, a long time volunteer, unloads the huge adults. The year 2000 was the most successful in the hatchery history with more than 1.25 million chinook eggs and 130,000 coho eggs collected and incubated. A total of 390,000 of the chinook eggs were from captive brood stock reared at a local fish farm.

3.2.7.2 Salmonid Enhancement Program

Western Forest Products Limited continues to support Salmonid Enhancement projects in its TFLs. Local volunteers, many of whom are Company personnel, provide volunteer labour and skills for these projects. Hatcheries and habitat improvement projects continue to be a highlight of the forest tours.

TFL 6 watersheds enhanced through the Company's support of salmonid enhancement projects include the Goodspeed and San Josef Rivers near Holberg, the Marble River west of Port McNeill, and the Colonial and Cayegle Creeks south of Port Alice.

In 2000 the hatcheries located within TFL 6 released 1 026 733 fry, an excellent accomplishment. (Appendix XI).

The forestry department and Western Forest Products Public Project costs associated with the Salmonid Enhancement Program were \$100,951. The federal Department of Fisheries and Oceans reimbursed \$15,000 of the Public Projects expenditures.

3.2.7.2.1 Cordy Creek – Holberg

Chinook, coho, chum and steelhead salmon fry were released into the Goodspeed River, and coho salmon fry were released into the San Josef River. A total of 187 570 fry were released from the Cordy Creek hatchery (Appendix XI). This represents a decrease compared to 1999, which was an exceptional year for fry release, but 2000 is still an above average year for number of fry released.

The Cordy Creek Hatchery is operated by the Holberg forestry department, volunteers from the community of Holberg and managed by Jeff Mosher, Operations Forester in Holberg. The year of 2000 marked the third consecutive year without supplement of chinook broodstock and eggs from the Marble River Hatchery indicating improved returns of this once depleted stock from the Goodspeed River. Steelhead returns in 2000 were above average. The Cordy Creek Hatchery produced 2 500 steelhead fry for the Goodspeed River. Demand for increased water flows to the hatchery for fry production required the installation of a new well pump. The new pump will add an additional 60 litres per minute of water to the existing supply and improve water quality for egg development.

3.2.7.2.2 Marble River – Port McNeill

The Friends of the Marble River manage the Marble River Hatchery and Rearing Channel, which are located west of Port McNeill. The Friends of the Marble River are a group of 117 volunteers who are responsible for enhancement of the Marble River Watershed. In 2000 the hatchery released 494 520 chinook fry, 250 643 coho fry and 35 823 steelhead fry (Appendix XI). The Hatchery also raised 200 000 coho for Washwalis, Waukwaas and Stephens Creek with assistance from the Port Hardy based NISEA.

Volunteers at the Marble River hatchery transfer adult chinook into a storage tank for holding until their eggs are ready for fertilizing. An average female produces more than 5000 eggs. A total of 544 adult chinook were utilized for egg takes in 2000, including 157 adult captive brood stock reared at a fish farm.

With the completion of the rearing channel in 1999 the raising of fish to the smolt stage has been made much easier. The Friends of the Marble River are continuing their work toward establishing improved rearing and spawning channels in the Marble River system .

The Friends of the Marble River also worked with the Watershed Restoration Program and created a side channel in the Howlall Creek to improve fish habitat.

3.2.7.2.3 Colonial Creek – Jeune Landing

The Colonial Creek Hatchery raised 94 000 coho and chinook that were released into the Colonial watershed in the spring of 2000 (Appendix XI).

2000 was a very productive year for the Colonial Creek Hatchery. The hatchery was operating at near full capacity throughout the year with a total of 58 000 coho and 36 000 chinook released between mid April and early June. Maintenance of the hatchery took place during the summer months. The main projects were replacement of the plumbing to the fish condos and pouring a cement pad under them.

There were two very successful brood stock captures in October with impressive community involvement including several of the local boy scouts. The total projected fry to be released from the 2000 brood year is 34 584 chinook and 58 796 coho or 93% of full capacity.

3.2.8 Wildlife Habitat

Special measures were taken to address wildlife values in 2 Jeune Landing engineered cut blocks as well as in 2 Holberg harvested cut blocks (Table 9). Western Forest Products' management approach is shifting from individual species to a landscape level approach where defined habitat types will be maintained to provide for a range of sensitive species. The Company will continue to inventory and individually manage special wildlife features like raptor nests and bear dens.

Habitat manipulation was undertaken on 14.8 ha to accelerate old growth stand attributes in second growth forest along the upper Keogh River. A faller tops and kills a young hemlock tree to create habitat for bats and other bird species.

3.3 Integration of Harvesting Activities

Western Forest Products encourages the use of the TFL 6 by other stakeholders. Mushroom and salal pickers have access to harvest areas and are only restricted by safety and fire regulations. Yew bark harvest is undertaken in areas under cutting permit. Agreements have been reached with First Nations to focus harvest of traditional materials, mainly cedar bark, in cutting permit areas. Beekeepers use company roads. Recreation use is encouraged through the maintenance of existing recreation sites and the expansion of others. However, commercial use of existing public sites is not permitted. Trapline holders are notified when new cutting permits are issued.

3.4 Forest Fire Management

3.4.1 Prevention

Fire Preparedness Plans were submitted to the Ministry of Forests in the spring of the year by all TFL 6 Operations. Holberg Operation maintained 3 weather stations while 2 weather stations were maintained by Jeune Landing Operation and 3 weather stations were maintained by Port McNeill Operation through the fire season. Total forestry costs for fire prevention and suppression were \$116,450.

3.4.2 Suppression

Holberg and Jeune Landing reported no accidental fires requiring suppression in the year. Port McNeill Operation had 1 accidental fire, which affected less than 33 ha of private land . (Appendix XI).

3.4.3 Fuel Management

The last TFL 6 fuel management plan was produced in 1995 covering the period 1996 through the year 2000. This plan uses fuel type, climatic zone, aspect, and slope to establish a hazard rating that is used to determine fuel management practices. The Fuel Management Plan will be updated during 2001. Slash and pile burning are generally not required for hazard abatement purposes. Roadside burning was carried out on 66.4 km of road in 2000 for silvicultural purposes.

3.5 Forest Health Management

Forest health is monitored as part of other regularly scheduled silviculture surveys. Specific forest health costs are only assigned when there is a specific forest health situation such as an insect outbreak.

Samantha Mellings plants weevil resistant Sitka spruce selections in a new seed orchard at the Saanich Forestry Centre. (Pissodes strobi) is a serious threat to young plantations of Sitka spruce and the company has worked many years to develop weevil resistant stock in conjunction with Ministry of Forests.

3.5.1 Disease Management

No unusual disease issues were identified during the year. Hemlock dwarf mistletoe and various root rots were noted during silviculture surveys or when preparing silviculture prescriptions and stand management prescriptions. Formal surveys and special management techniques are employed when unusual situations are encountered. None were identified in 2000.

3.5.2 Insect Management

The western black-headed budworm (*Acleris gloverana*) outbreak has receded to background levels from the outbreak in 1997/98. Aerial surveys conducted during other normal activities showed good recovery in both second growth and old growth damaged by the previous year's infestation. Costs to monitor the outbreak were \$1,040.

Ambrosia beetle (*Gnathotrichus* spp. and *Trypodendron lineatum*) trapping continued at the Port McNeill Dryland Sort. In 2000 there were traps set of *Trypodendron lineatum* only. This years catch, though down from last year, was normal due to inhospitable spring conditions and lack of inventory during shutdown. This year's numbers were also reduced due to the exceptional catch last year. The costs of the ambrosia beetle-trapping program are covered in logging costs.

Table 12 Ambrosia Beetle Trapping Summary – Port McNeill Dryland Sort

Species	Year		
	1998	1999	2000
<i>Gnathotrichus</i> spp.	750	1750	0
<i>Trypodendron lineatum</i>	348525	1606605	624030
TOTAL	349275	1608355	624030

3.5.3 Ungulate Management

Deer browsing of regeneration is not a significant problem in most areas of TFL 6. No browse guards or repellents were installed or maintained in the year. Ungulate habitat models were used to help identify suitable habitat during the Landscape Unit Planning Process. Ungulate winter ranges remain in place.

Two young deer bucks browse vegetation in the Jeune Landing Forest Operation. Current deer populations in TFL 6 are depressed due to high cougar and wolf predation. Historically the cycle of deer peaks is probably more than 20 years.

3.5.4 Abiotic Factors

Several areas of windthrow were detected during the year. Silviculture Plans were submitted for 6 salvage areas. Several harvested blocks were modified to reduce windthrow. A Timber Loss Ledger (Appendix XXIV) was developed during the year to track the amount of non-recoverable losses within the TFL. During 2000 there were 31,710 m³ damaged from wind. Only approximately 920 m³ of this volume was classified as non-recoverable.

Work was completed on a study to look at the effects of windthrow on Riparian Areas. Approximately 78 km of forested riparian boundary were evaluated and found that an average of 21% of timber blew down with occasional occurrences of 10 – 20% of stream bank disturbances. Further studies are planned in 2001 to more closely evaluate the impacts of the windthrow on stream channel morphology.

3.6 Silviculture

3.6.1 Reforestation

Western Forest Products owns seed orchards licensed by the Ministry of Forests to produce high quality seed and stockings. These orchards are located at the Saanich Forestry Centre and the Lost Lake Field Operation on south Vancouver Island. Two western red cedar orchards, two western hemlock orchards, and two coastal Douglas-fir orchards yielded seed for more than 8.8 million plantables in 2000. Other mature licensed orchards were not managed due to large seed inventories on hand from past crops.

To improve the quality of seed obtained from the mature low-elevation western hemlock orchard at Lost Lake, low breeding value individuals were removed. Supplemental mass pollination, an excellent cone set, and good harvest management resulted in a bumper crop for more than 6.9 million plantables (Appendix XXII). This is Western Forest Products' first significant high-gain crop in hemlock. Average volume gain from this crop is projected to exceed 9 per cent at rotation.

Western hemlock cones are still being produced at Lost Lake Seed Orchard. This low elevation orchard yielded seed with a potential of more than 6 million plantables and a projected volume gain of 9% or greater. Most of WFP's tree improvement activities are now conducted at the Saanich Forestry Centre but some work and seed production continues at the Lost Lake field site.

Funds from the Operational Tree Improvement Program (Forest Renewal BC via the Forest Genetics Council) assisted in delivering the gain. These two seedlots are suitable for reforestation throughout TFL 6 to elevations of 600 m. A small custom seedlot was developed in the high elevation hemlock orchard at Lost Lake. The 74,000 potential plantables from this control pollination crop are suitable for reforestation throughout TFL 6 in the elevation band from 122 m to 722 m.

The coastal Douglas-fir seed extracted from 24 hl of cones is projected to yield 0.4 million seedlings (Appendix XXII). The bulk of the crop resulted from supplemental mass pollination, funded in part by the Operational Tree Improvement Program. This seed is suitable for use in TFL 6 to elevations of 700 m.

The red cedar orchards at Lost Lake provided seed for an estimated 1.4 million plantables (Appendix XXII). Yields were extremely low in both orchard crops; seeds per cone were in the order of 25% of historical average yields in orchard 128. The cause of the low seed yield is under investigation. Gain associated with the seed harvested from the tops of trees is estimated at 5 per cent at rotation, based on the DNA analysis results that confirmed high out-crossing. The seed produced from both orchards is suitable for use throughout TFL 6 to elevations of 640 m with the custom lots to elevations of 730 m.

Cuttings from the yellow cypress clonal hedges at the Saanich Forestry Centre yielded cuttings for 252,000 stecklings. Of these, about 30% have an average projected gain in volume at rotation exceeding 5 per cent.

No wild stock seed collections were made within TFL 6 during the year.

Intense planting activity occurred at Saanich Forestry Centre in the fall of 2000. This continued the consolidation of orchards to the Saanich site. Four new orchards were established and the bulk of a fifth orchard was planted:

- The new western red cedar low elevation orchard contains 509 trees. The estimated average gain in volume at rotation from seed produced in this orchard is 8 per cent. Seed from this orchard can be used in all Vancouver Island tenures and all Mainland tenures south of 52°50', to elevations of 600 m. This orchard was designed to test alternate methods of pollen management for increased out-crossing.
- All low elevation western red cedar in test was grafted at Saanich Forestry Centre in early 2000 under an Operational Tree Improvement Program project funded by Forest Renewal BC through the Forest Genetics Council. This material will be used to replace low-gain individuals with high-gain individuals when test results become available. The purpose of this project is to realize the gains from the progeny-testing program at the earliest possible date. Through this effort, an orchard with estimated gain of 12 per cent is anticipated by 2007.
- The new western red cedar Queen Charlotte Islands orchard contains 160 trees. The design of the orchard facilitates early roguing with four trees planted near each final orchard position. Only the best as proven by progeny results will remain post-roguing. Seed from this orchard can be used in all Maritime zones from 49° 46' north to the Alaska Panhandle to elevations of 650 m.
- The new western hemlock high elevation orchard contains 275 trees. All trees in the orchard are in test, and additional trees in test may be added to the orchard to provide a significant quality boost in seed produced from the post-rogue orchard. Seed from this orchard is appropriate for all coastal maritime lands south of 53° 31' for the elevation band from 400 m to 1000 m.
- The Sitka spruce weevil resistant orchard now contains 330 trees, up from about 100 trees at the beginning of 2000. Weevil-resistance of this orchard is currently (from early test results) estimated to average 6, or 60 trees out of 1000 planted with this stock on

Marilyn Sam sets yellow cedar cuttings at the company's Saanich Forestry Centre. Most of the yellow cedar planted in WFP's managed forests are stecklings produced from hedges maintained at the orchard.

average would be attacked in a given year in a high weevil hazard area. Seed from this orchard is appropriate for all coastal maritime tenures north to 53° 42' and to elevations of 400 m, with testing in place to extend the elevation range.

Repair and maintenance of the vandalized western hemlock orchard continued at Saanich Forestry Centre. Copies of all stock in the orchard were grafted to replace the damaged trees in the event that repair efforts fail. Surplus copies of some clones received from the Cowichan Lake Research Station were planted in the orchard. Funding for the repair was received in part from Forest Renewal BC.

Western Forest Products personnel implemented the Sitka spruce breeding program at field trial locations. This project, funded by Forest Renewal BC through the Forest Genetics Council Operational Tree Improvement Program, yielded control-cross seed for further testing of weevil resistance, and significant amounts of surplus seed for operational reforestation purposes. Our share of the surplus control-cross seed should deliver more than 80,000 highly weevil-resistant Sitka spruce plantables for the 2003 spring planting program.

Results of more than a decade of yellow cypress field trials are paying back with the establishment of high-gain hedge orchards at Saanich Forestry Centre. As more data becomes available, new selections will be added to the orchards. Rejuvenation of selected hedges continued with funding from the Operational Tree Improvement Program. A crop failure in the third rejuvenation resulted in a set-back; this rejuvenation will be repeated in 2001.

Effort will be made to rejuvenate and bulk-up all clones with projected gain at rotation exceeding 12 per cent. To date, more than 11,000 ramets representing some 200 tested clones with projected gain at rotation greater than 5 per cent are located in hedge orchards at Saanich Forestry Centre. As their size and productivity increases, lower value clones will be removed from the orchards.

The prorated share of the costs of tree improvement and orchard consolidation to TFL 6 for the year was \$211,277. The prorated share of reimbursements from the Operational Tree Improvement Program was \$38,982.

Each year several hundred visitors tour the company's Saanich Forestry Centre. Cathy Cook, Senior Technician, explains the reforestation process to a group of Beavers from the local area.

3.6.1.1 Site Preparation

Site preparation tools on north Vancouver Island include broadcast burning, pile burning, and mechanical site preparation. These techniques are employed to improve plantability or reduce brush competition. Appendix XI details the 2000 site preparation program. Costs for site preparation in TFL 6 were \$70,073.

3.6.1.1.1 Broadcast Burning

There was no broadcast burning in TFL in 2000. Although burning was planned it was not possible due to poor weather conditions. Smaller cutblock sizes and the increased number of reserves and retention areas have made prescribed burning both difficult and expensive. This is only the fourth year in the past thirty where broadcast burning was not used as a silvicultural tool.

3.6.1.1.2 Pile Burning

Roadside debris was piled and burned at all Operations in TFL 6: Port McNeill completed 26.9 km of roadside burning, Holberg completed 40.5 km, and Jeune Landing 20.8 km for a total of 88.2 km (Appendix XI). New propane burners were constructed for Holberg and Port McNeill Operations. The use of this system should increase the safety and efficiency of pile burning activities. Average cost was \$641 per km.

3.6.1.1.3 Mechanical Site Preparation

Holberg used excavators to prepare planting spots on 1.6 ha of harvested area (Appendix XI). Costs for mechanical site preparation averaged \$330 per ha.

3.6.1.2 Planting

Silviculture contractors planted 1.04 million seedlings on TFL 6 during the year. Original plantations were established on 957.2 ha and fill-plants or replants carried out on an additional 34.4 ha of previously planted area (Appendix XI). The NSR area recorded on the TFL 6 Regeneration Balance sheet increased during the year (Appendix XII). Appendix XIII summarizes the planting history of TFL 6.

Fertilization at time of planting improves the growth of conifer seedlings on salal-dominated sites. Western Forest Products Limited fertilized 483 269 seedlings at time of planting in 2000. The bulk of the seedlings planted on TFL 6 were western red cedar (42

A tree planter works in a Mahatta River slash area during spring planting. An average planter puts in more than 750 trees per day. More than 1 million trees were planted in TFL 6 in 2000.

per cent). Other major species were amabilis fir (28 per cent) and western hemlock (18 per cent). The planting program also included small numbers of cypress, Douglas-fir, Sitka spruce and shore pine.

Costs for the planting program totalled \$1,016,558. This averages to \$1,026 per ha or \$0.98 per tree. This included stock purchase and inspection, planting costs and fertilization at time of planting costs. Forest Renewal BC's Backlog Program reimbursed the Company \$13,100 for areas logged prior to October 1, 1987 that remain a government responsibility.

3.6.1.3 Stocking Surveys

Surveys of naturally regenerated areas at Holberg, Jeune Landing, and Port McNeill showed high success rates. Of 82.1 ha surveyed all were satisfactorily restocked (Appendix XI). The natural regenerated area is credited to the regeneration balance sheet (Appendix XII).

Ninety-nine percent of the plantation area surveyed met or exceeded TFL 6 stocking standards (Appendix XI). Only 30.3 ha of a surveyed 2 137.3 ha were not satisfactorily regenerated. The NSR area is debited to the regeneration balance sheet (Appendix XII) and scheduled for treatment. The Not Satisfactorily Regenerated balance for TFL 6 was 1 213 ha as of December 31, 2000.

Costs for stocking surveys in TFL 6 were \$94,873 or \$44 per ha. The FRBC reimbursements for stocking surveys was \$6,845 for areas logged prior to October 1, 1987 that remain a government responsibility.

3.6.1.4 Planting Survival Assessments

Second year survival assessments of planted areas showed high survival rates, exceeding 90% for all Operations. Survival assessments were conducted on a total of 508.7 ha of TFL 6 plantations (Appendix XI).

Survival assessments cost \$35,973 or \$71 per ha.

3.6.1.5 Free Growing Surveys

Port McNeill, Holberg and Jeune Landing Operations carried out free growing surveys during the year. A total of 2 637.9 ha were surveyed. 35% of the surveyed area (922.8 ha) met Management Plan free growing standards. Only minor treatments and some extra time are necessary to declare the balance free growing. (Appendix XI). Costs for free growing surveys were \$64,113 or \$24 per ha. Forest Renewal BC reimbursed the Company \$4,950 under the Backlog Forestry Program for areas logged before October 31, 1987.

3.6.2 Stand Management

3.6.2.1 Juvenile Spacing

Both Port McNeill and Holberg Operations implemented spacing programs during the year (Appendix XI). Silviculture contractors spaced a total of 68.9 ha of dense regeneration on TFL 6. Costs for spacing were \$174,852 or \$2,534 per ha and were reimbursed by FRBC.

3.6.2.2 Brushing and Weeding

Silviculture contractors carried out brushing and weeding treatments on 1170.4 ha of forest land. A variety of brushing and weeding techniques successfully reduced alder and salmon berry competition (Appendix XI). Costs of the brushing and weeding program were \$600,750. Forest Renewal BC reimbursed the company \$302,183 for brushing and weeding for areas logged before October 31, 1987.

3.6.2.3 Pruning

All Operations implemented pruning programs during the year. Silviculture contractors pruned 374.1 ha of previously spaced stands (Appendix XI). Costs for pruning totalled \$797,126 or \$2 131 per ha. Forest Renewal BC reimbursed the company \$796,141 under the Enhanced Forestry Program.

3.6.2.4 Fertilization

Holberg Operation carried out a small fertilization program in 2000. A total of 58.8 ha were fertilized in TFL 6 (Appendix XI). Total fertilization expenses were \$45,748 and were reimbursed by FRBC.

West Coast helicopter reloads fertilizer hopper to make another application in Block 804 at the Holberg Forest Operation. The nitrogen/phosphorous fertilizer is applied at 740 kg per hectare. The goal of this treatment is to increase the annual height and diameter growth in the young hemlock stand and decrease the time to achieve crown closure.

3.7 Roads and Bridges

3.7.1 Construction

Road building in 2000 included 77.7 km of new construction and 11.9 km of rebuilt road (Table 12). Seventeen bridges were constructed by the operations. Jeune Landing's first portable bridge was installed across the Upper Marble River. In Holberg, the Stranby River was crossed with a 36 metre steel/concrete structure.

Table 12 Road and Bridge Construction Summary

Operation	New Roads (km)	Rebuilt Roads (km)	Bridges (#)
Holberg	32.1	0	2
Jeune Landing	21.0	7.0	1
Port McNeill	24.6	4.9	14
TOTAL	77.7	11.9	17

3.7.2 Maintenance

Nine hundred and thirty kilometres of road were maintained in TFL 6. Appendix XI provides a summary by Operation.

3.7.3 Current Deactivation

Temporary, semi-permanent, and permanent deactivations of roads are obligations in current areas. Operations deactivated 62.7 km of road during the year: 34.9 km was temporarily deactivated, 9.5 km was semi-permanently deactivated, and 18.3 km was permanently deactivated. Appendix XI lists the amount of deactivated road by level of deactivation and Operation.

3.8 Employment and Economic Opportunities

3.8.1 Direct Employment

The following sections outline direct forest management and manufacturing employment for TFL 6. The manufacturing employment is for the TFL 6 volume processed in Western Pulp or Doman mills and the sales and trading operations. Direct mill employment outside of the Doman-owned facilities is not available for wood sold or traded from TFL 6.

3.8.1.1 Planning, Engineering and Road Development

Planning, engineering and road development for TFL 6 took place at each Forest Operation, in the Port McNeill Regional office and at the Company's head office in Vancouver. Planning and development at the regional level included implementation of the watershed restoration program and mapping for development plans. Planning, engineering

and road development employed 85 company and contract employees for 8 542 days of which (Appendix XV – A). 33% were company personnel.

3.8.1.2 Harvesting

Harvesting employment includes the support staff at each Operation. Ninety percent of the 466 people employed in harvesting are local residents and 54% are contract employees. TFL 6 harvesting person-days totalled 65 732 (Appendix XV – A) for the year.

3.8.1.3 Transportation

Logs were barged or towed from northern Vancouver Island to processing facilities and markets in the south. Seaspan International held the barging contract and Pacific Towing the towing contract. Log movement generated 6 745 person-days of employment (Appendix XV – A).

3.8.1.4 Processing

Nine Doman and Western Pulp mills processed wood from TFL 6. These were Duke Point Sawmill, Ladysmith Sawmill, Cowichan Bay Sawmill, Silvertree Sawmill, Squamish Sawmill, Nanaimo Sawmill, Vancouver Sawmill, Nanaimo Log Merchandising, and the Port Alice Pulp Mill. Chips from the sawmills were sent to WP's Squamish Pulp Mill. A portion of the TFL 6 volume was either sold or traded to other forest companies or manufacturers.

Prorated direct employment based on wood flow and consumption estimates totalled 71 328 person-days (Appendix XV – A). This total does not include employment generated by TFL logs that were sold or traded to other manufacturers.

3.8.1.5 Silviculture and Integrated Resource Management

Basic and enhanced silviculture, and integrated resource management projects employed 400 people throughout the year at the Operations and Region. 79% were employed by contractors. 12% of the basic and enhanced silviculture employees were local residents who generated 33% of the person-days (Appendix XV – A). The TFL 6 prorated share of the Saanich Forestry Centre employment (59 full time or seasonal employees) was 1 450 person-days. Silviculture and Integrated Resource Management generated 12 865 person-days

Community Forestry Program summer student workers undertook pruning in thinned second growth stands at Jeune Landing. This successful program has employed hundreds of young workers since 1988 on valuable silviculture projects. A total of 10 students and two supervisors worked on WFP projects in 2000.

of employment in the year. Western Forest Products' policies continued to focus on the development of First Nations and other local skilled crews.

3.8.1.5.1 Administration

Administration of the TFL is carried out from the Forest Operation, Regional and Corporate offices. 39 Company employees spent a portion of their time in the administration of TFL 6. The pro-rated share of administrative employment for TFL 6 was 3 051 person-days for the year.

3.8.2 Indirect Employment

TFL 6 activities also support secondary jobs in the local communities of Holberg, Port Alice, Port McNeill, Coal Harbour, Quatsino, Winter Harbour, and Port Hardy. While these communities are slowly diversifying their economies, they all still rely heavily on the forest industry.

Central Island, South Island and lower Mainland communities also benefit from the timber produced from TFL 6 through secondary jobs. Significant income is generated in the processing locations: Nanaimo, Ladysmith, Cowichan, and Vancouver. Additional indirect and induced jobs are supported province-wide through services and supplies.

Indirect job opportunities are supported by TFL 6 through the spending of wages from direct jobs. This spending supports jobs in the service, retail, finance, and housing industries.

The Provincial Government stumpage and royalty revenue from this tenure was about \$31.5 million in 2000. Both the Federal and Provincial Governments collected significant revenue from income and other taxes as a result of TFL 6 logging, forest management, and timber processing. Municipal Governments also receive revenue through taxes from TFL 6 operations within their jurisdictions. Indirect jobs within Government Ministries and agencies at all levels are supported by this revenue.

The ratio of direct employment to indirect and induced employment used in this analysis is 1:2 (Price-Waterhouse). For every employee directly supported by TFL 6 activities, two additional people are indirectly employed through private and public sector agencies. The estimated number of person-days of indirect and induced employment generated by TFL 6 activities in 2000 was 336 526. At 180 person-days per year, TFL 6 activities supported more than 1 870 full-time equivalent indirect jobs.

3.8.3 First Nations Employment and Initiatives

The Company continued to work closely with the Quatsino First Nation on their phase logging contract. A total of 29 700 m³ were harvested by the Quatsino Forestry Company.

Western Forest Products continued to assist the Quatsino First Nation with the management of Woodlot Number 72, which is encompassed by TFL 6.

The Company continued to work on expanding its relationship with the Kwakiutl First Nation and supported the Kwakiutl First Nation Forestry Coordinator. The coordinator worked with the Company and band on implementing training initiatives, hiring programs and silviculture programs. The coordinator also acted as a lead contact for operational plan reviews.

Mickey Brown, Port McNeill Operations Manager, explains grapple yarding to a group of First Nations representatives during a field tour as part of a company workshop on First Nations involvement.

A combined Quatsino and Kwakiutl silviculture contracting company continued to work within the TFL. The new band-endorsed company received several direct award contracts in spacing, pruning and brushing.

Silviculture contracts in TFL 6 provided 1 245 person-days of First Nation employment in 2000. This was more than 30% of the contract silviculture work on the tenure. The Company target of providing a minimum of 20% of the silvicultural contract employment on a tenure to First Nations was exceeded. Appendix XV-C provides First Nations silviculture contract information.

3.9 Performance Monitoring

The Ministry of Forests carried out 178 harvest inspections in TFL 6 during the year. 175 were found to be in compliance and only minor instructions were issued. The three inspections which were not in compliance did not result in any formal actions. However, there was one warning ticket issued related to Special Forest Products.

The internal audit team continued conducted audits during 2000. Koprino and Quatsino Forestry Contract Operations, Quatsino Dryland Sort and the Regional office were audited against the implementation of the Environmental Management System. Through the audits 10 non-conformance items were identified. Auditors discovered a few workers without maps, some incomplete records and a few petroleum spill and handling issues. Appropriate Corrective Preventative Action Reports were developed for each item and action plans have been implemented to address the findings.

The whole company underwent an ISO 14001 Registration Audit conducted by Quality Management Institute. This audit resulted in the certification of all operations of the Company in April of 2000.

Auditors from QMI completed assessment of TFL 6 to determine compliance with ISO 14001 requirements. The company achieved ISO registration in April 2000.

4.0 TIMBER PROCESSING

An estimated 1 012 000 m³ of TFL 6 logs were processed at seven Company owned mills on the lower mainland and southern Vancouver Island as well as at the Port Alice Pulp Mill on Northern Vancouver Island. An additional 124 000 m³ of TFL 6 logs were sold or traded on the Vancouver Log Market. The following mills received logs from

TFL 6 in 2000:

- Port Alice Pulp Mill - 195 000 m³ or 20% of its wood needs for the year.
- Duke Point Sawmill – 348 000 m³ or most of its wood needs for the year.
- Ladysmith Sawmill - 224 000 m³ or 67% of its wood needs for the year.
- Silvertree Sawmill – 90 000 m³ or 23% of its wood needs for the year.
- Vancouver Sawmill – 83 000 m³ or 33% of its wood needs for the year.
- Cowichan Sawmill – 24 000 m³ or 7% of its wood needs for the year.
- Nanaimo Log Merchandizer – 45 000 m³ or 7% of its wood needs for the year.
- Nanaimo Sawmill – 3 000 m³ or 1% of its wood needs for the year.

The Chemainus Value-Added Mill re-manufactured 140 thousand cubic metres of lumber during the year. Some of this volume came from these facilities. The Squamish Pulp Mill consumed 726 000 units of chips. Ten percent of this volume came from TFL 6 logs manufactured at these mills. Estimates of log flow and wood consumption are summarized by tenure in Appendix XVII.

5.0 RESEARCH

Western Forest Products promotes development of silvicultural techniques through an active research program. Additionally, the Company supported a number of university projects at the University of British Columbia, Simon Fraser University, and the University of Victoria with funds and in-kind support. Data collections and reports completed in the year are noted in the following sections. All active projects in TFL 6, including those not scheduled for monitoring in the year, are listed in Appendix XVIII.

Forestry Department research costs for TFL 6 totalled \$144,849 including the prorated share of the Saanich Forestry Centre's tree improvement research program. Reimbursements totalling \$71,099 were received from Forest Renewal BC via the Science Council.

5.1 Silviculture and Stand Management Research

5.1.1 5.1.1 Salal Cedar Hemlock Integrated Research Program (SCHIRP)

Research trials and surveys continued on northern Vancouver Island to determine the effect of fertilization on salal-dominated stands. The SCHIRP research team includes corporate, federal and provincial government, and University personnel. Western Forest Products has promoted this research team since its inception. Findings from the SCHIRP trials and surveys have led to the implementation of extensive fertilization programs including both broadcast fertilization and individual tree fertilization at time of planting. Funding for portions of this work was received from Forest Renewal BC through the Science Council.

Research trials established in 1996 include examination of the effects of fertilizer on transitional sites. These sites are recognized generally as S1HA sites with an abundance of salal. Five-year measures of these trials indicate that fertilization has a beneficial effect on growth of hemlock and cedar.

The individual tree fertilization trial established on S1CH at Holberg indicates that fertilizer formulation and placement affects the performance of treated western red cedar. The five-year data is being analysed.

Five-year data indicates that the scarification trial, established on S1CH ground is performing very well. All western red cedar and western hemlock planted in this trial were fertilized at time of planting. Analyses of the operational fertilization monitoring surveys are underway.

John Russell, Ministry of Forests cedar and cypress tree breeder, leads a tour group through the cypress trial area on Pemberton 400 during a tree improvement workshop.

A draft report is under compilation. Publication is anticipated in 2001. Updates of the long-term trials and initial findings of recent trials will be included.

5.1.2 Drainage Trial

Maintenance and monitoring of the Suquash Main drainage trial continued in 2000. Extensive monitoring and reports are scheduled for 2001, the fifth year of the study. Funding for this work was received from Forest Renewal BC through the Science Council.

5.2 Genetics Research

Maintenance of the nine yellow cypress clonal trials continued in TFL 6 throughout 2000. An estimated 2000 clones are included in the tests. Measurements of the fifth phase at Port McNeill, after seven growing seasons, were recorded in 2000. Top performers are being identified for inclusion in the tree improvement program. Funding for this work was received from Forest Renewal BC through the Science Council.

5.3 Forest Inventory

Photo Interpretation and quick plot sampling was completed for the new Vegetation Resource Inventory on TFL 6. More intensive fieldwork will be completed in early 2001.

Young bald eagles participate in a feeding frenzy at the Marble River hatchery dock in TFL 6. There are more than 180 eagle nests inventoried in TFL 6 which are protected during timber harvesting and forestry operations

6.0 GOALS AND INITIATIVES

Western Forest Products manages TFL 6 consistent with the objectives outlined in Management Plan 8. Appendix XX outlines progress made in addressing Management Plan 8 commitments and issues in 2000. In 2000 draft Management Plan 9 was submitted to MOF, public, and stakeholders for review and comment. For 2001 there are specific silviculture, planning, inventory, research, recreation, First Nations and market goals.

The silviculture goals are to complete all basic silviculture obligations according to operational plan schedules as well as to pursue opportunities to expand the current enhanced silviculture programs. Program details are provided in Table 14.

Table 14: Goals for 2001

Silviculture	Site Preparation	30 ha
	Planting	1300 ha
	Silviculture Surveys	3000 ha
	Brushing	1000 ha
	Free Growing	2000 ha
	Spacing	300 ha

In 2001 plans are to start operational mapping in the region beginning with Port McNeill Forest Operation.

In 2001 Forest Inventory efforts will focus on completion of TFL 6. Wildlife surveys will continue with detection work on northern goshawks.

Current research projects will be maintained. There will be continued monitoring of SCHIRP and the Suquash drainage site and further research into windthrow management and estimates of windfall damages to streams.

Recreation goals will be to maintain existing WFP sites within TFL 6 as well as to continue conservative development of SMZ #2 while respecting the SMZ recreation objectives. There will be an attempt to resolve Raft Cove public access issues.

First Nations efforts will be concentrated on continued capacity building with both the Quatsino and Kwakiutl First Nations. The Quatsino First Nation currently logs, does silviculture work and completed some assessments for WFP. The Kwakiutl First Nation currently does silviculture work and has some members training and employed in logging for WFP.

Certification was a high priority in North Vancouver Island Region during 2000. The company attained ISO 14001 Certification in all 41 of its Forest Operations. This was a significant task and was stated as one of the most complicated assessment in coastal British Columbia. Significant efforts were concentrated on preparation and completion of field assessments against the FSC Certification Principles and Criteria. The FSC Field Assessment took place in February with a follow-up evaluation later in December. While FSC Certification was not achieved in 2000, significant progress was made towards this goal. The company also began a process to establish a Community Advisory Group in partnership with Weyerhaeuser. The group will establish local values, goals, indicators and objectives to help guide WFP's sustainable forest management initiatives. The group is an important part of the company's CSA certification initiative. The Company will continue its efforts to maintain ISO certification and obtain FSC and CSA certification for TFL 6 forest operations in order to aid marketing of forest products in foreign markets.

7.0 ADMINISTRATION

The costs of supervision and overhead relating to specific operational projects are included in the reported project costs. However, many administrative costs are broadly defined as general management and overhead. These include Company prorated charges to the Forestry Department for rentals and services as well as salaries and expenses to perform administrative functions, including certification activities. Total costs for administration were \$778,912.

Bill Dumont, WFP's Chief Forester, presents a book of historical photographs to Heritage Society President, Marg Hanuse, at the opening of the attractive new Port McNeill and District museum in Port McNeill.

8.0 FINANCIAL STATEMENTS

8.1 Forest Management Costs

The following summary presents all TFL 6 Forest Management Costs incurred or expended by Western Forest Products and other agencies at the field level. Planning, supervision, and overhead costs directly related to programs as well as program application costs are included before credits or reimbursements. A prorated share of head office forestry department and Saanich Forestry Centre costs are included as well.

Program	Section		Sub-Total
Planning			\$568,906

TREE FARM LICENCE 6
Coastal Contractor Clause Performance Report

CALENDAR YEAR 2000

Reference	Description		Source
1)	Total AAC of TFL approved by Chief Forester (CF) that is available to Licencee	1 464 264 m ³	CF's approval letter for management and working plan
2)	AAC attributable to Schedule "B" lands that is available to Licencee	1 137 733 m ³	Derived from the approved MWP
3)	Volume of timber harvested	1 136 285 m ³	Obtained from the Regional Timber Officer of District Manager; the total volume of timber that is billed to the Licencee under the Licence during the calendar year (Section 49.1 of Forest Act)
4)	Harvested volume attributed to Schedule "B" lands	882 893 m ³	Calculated: (#2/#1) X #3
5)	Total volume contracted under full and phase contracts	507 310 m ³	Licencee Records
6)	Total volume contracted expressed as a per cent of compliance required	114.9 %	Calculated: (#5/(#4 X 0.5)) X 100

Licencee Name: Western Forest Products Limited

Completed by: William Dumont, R.P.F.

Date Report Completed: May 3, 2001

Appendix IX

TREE FARM LICENCE 6 Partitioned Harvest Performance Summary – 2000

MEDIUM, LOW, AND VERY LOW SITES¹

Operation	Cutting Permit Numbers	Logged			
		Productive	Non-Productive	M/L/VL Ecosites ²	
		Area (ha)	Area (ha)	Area (ha)	Volume (m ³)
Holberg				107.8	93077.5
Jeune Landing				10.7	9052.9
Mahatta				0.0	0.0
Port McNeill				135.8	112777.4
TOTAL				254.3	214907.8

¹ Performance must be 52 000 m³ minimum per year on a five-year average.

² Inventory/MP basis only. Volume estimates per hectare are higher than actual production.

**Doman Forest Products Limited
Western Pulp Inc.
Western Forest Products Limited
Doman – Western Lumber Ltd.**

2001 Operating Statistics

Productive Forest Land Managed	885 000 ha
Operable Forest Land	550 000 ha
Forest Tenures	3 Tree Farm Licences
	7 Forest Licences
	5 Managed Forests
	127 Timber Licences
Logging Operations	30
Employees and Contractors	4 200 people (est)
Annual Timber Harvest	4 100 000 m ³
Annual Timber Purchase	1 600 000 m ³
Mills	2 Pulp Mills – 1 Kraft, 1 Sulphite
	9 Saw Mills
	1 Value Added Plant (80 million bd. ft.)
	1 Log Merchandiser
Products: Lumber and Solid Wood	1.2 Billion board feet
Pulp	420 000 tonnes
Annual Product Sales	\$900 million
Annual Roads Construction	325 km
Annual Roads Maintenance	2 150 km
Annual Logging	5 400 ha
Annual Planting	5 100 ha
Annual Natural Regeneration	300 ha
Annual Number of Seedlings Planted	4 800 000 trees
Average Survival of 3-year Old Plantations	90 %
Annual Brushing and Weeding	2 200 ha
Annual Juvenile Spacing	1 450 ha
Annual Pruning	950 ha
Annual Fertilization	2 800 ha
Annual visitors to Forest Lands	over 300 000 visitors
Annual Salmon Enhancement Production (4 hatcheries)	900 000 fry
Recreation Sites and Trails	45
Forest Enhancement Person-Days	over 40 000

Appendix XX

Summary of Obligations Management Plan Commitments and Issues* Status Report

Commitment	Timeline	Status
Refine Site Index/Ecosite Relationship	Prior to MP 9 draft	A project was completed by J.S.Thrower & Associates that confirmed relationship.
Confirm yield curve and stand density relationship	May 31, 1996 for review. Next MP for changes.	Used MOF growth models for MP 9.
Address Inventory gaps	Prior to preparation of 20 year plan (Dec 96 Target).	Recreation – Opportunity mapping done and inputted into GIS. Terrain/Silviculture – Completed and inputted into GIS. Wildlife – Habitat prediction models were developed and tested in 1999. Models were found to yield accurate results. Stream Classification – RIC inventory in progress to supplement operational work. Archaeological Sites – Captured from HCB records. Biodiversity – T. Lewis completed ecosystem and forest cover work to supplement D. Blood report. TRP – Spatial mapping tool was switched to COMPLAN for use in MP9
Deciduous stands will be harvested and replaced with conifers through the rotation as opportunities arise.	No date.	Harvesting of deciduous stands was included as part of the long term harvesting plan in MP 8. However, such stand conversion was viewed as occurring concurrently with the harvest of adjacent second growth coniferous stands. WFP has not yet reached this point in time and very little harvesting is occurring in these younger stands. We have invited deciduous contractors to bid on stand conversion.
Accounting for non-recoverable losses.	During term of MP.	Ledger developed in 2000. See Appendix XXIV.
Feasibility study of commercial thinning	During term of MP.	A series of CT trials have been completed using different systems (cable, CTL and hoe-forwarding. Results are not encouraging for both economic and forest health reasons. Projects have been uneconomic and level of damage in hemlock stands has been unacceptable.

* Outstanding commitments and issues that were contained in the implementation section of the TFL 6 AAC rationale, the approval letter and in the AAC rationale report for management Plan 8.

1 Estimated gain in volume over wild seedlots at age 60.

2 Will be combined with 61128 or 61129, based on pollen contamination study results.

3 BV vol. 60 estimated, awaiting confirmation from DNA out-crossing studies.
